TM 8-625

CASSETTE CHANGER,
STEREOSCOPIC, UPRIGHT,
MAGNETICALLY CONTROLLED

WAR DEPARTMENT • 6 OCTOBER 1944

United States Government Printing Office

Washington : 1944

WAR DEPARTMENT,
WASHINGTON 25, D. C., 6 OCTOBER 1944.

TM 8-625, Cassette Changer, Stereoscopic, Upright, Magnetically Controlled, is published for the information and guidance of all concerned.

[A. G. 300.7 (2 Aug 44).]

BY ORDER OF THE SECRETARY OF WAR:

G. C. MARSHALL,
Chief of Staff.

OFFICIAL:

J. A. ULIO,
*Major General,
The Adjutant General.*

DISTRIBUTION:

As prescribed in paragraph 9a, FM 21-6, except ROTC (0);
ID 8 (2); IR 8 (2); IC 8 (2); Med Tech Schs (2).

ID 8: T/O 8-550, Gen hosp 1000-Bed; 8-550, Gen hosp 1500-Bed; 8-550, Gen hosp 2000-Bed.

IR 8: T/O 8-580.

IC 8: T/O 8-667; 8-187.

For explanation of symbols, see FM 21-6.

CHAPTER 1

INTRODUCTION

Section I. GENERAL

1. SCOPE. a. This manual is published for the information and guidance of all personnel charged with the operation and maintenance of Cassette Changer, Medical Department Item No. 60117, in the field. It contains instructions for assembling, operating, first and second echelon maintenance, and packing. The text is supplemented by illustrations and wiring diagrams.

b. A Standard Nomenclature List for each manufacturer is included in the appendix.

Section II. DESCRIPTION AND DATA

2. DESCRIPTION. General information. The cassette changer is an instrument used in taking radiographs of the chest. It provides a means of holding and moving into position two films. The unit provides for the accommodation of accessory devices necessary for making stereoscopic Potter-Bucky radiographs of the chest.

3. DATA. a. Performance. Most machines operate on 110- to 120-volt, 60-cycle, a-c. It is possible to secure machines at 25 and 50 cycles when such frequency is required.

b. Manufacturers. (1) The Standard Motor-Driven Horizontal Cassette Changer, Model HCC, is manufactured by the Standard X-Ray Company of Chicago, Illinois.

(2) The G. E. Motor-Driven Cassette Changer is manufactured by the General Electric X-Ray Corporation of Chicago, Illinois.

(3) The Westinghouse Horizontal Cassette Changer is manufactured by the Westinghouse Electric and Manufacturing Company of East Pittsburgh, Pennsylvania.

Figure 1. Cassette Changer, Standard X-Ray Company.

Figure 2. Cassette Changer, General Electric X-Ray Corporation.

Figure 3. Cassette Changer, Westinghouse Electric and Manufacturing Company.

CHAPTER 2

OPERATING INSTRUCTIONS

STANDARD X-RAY COMPANY MODEL

Section I. GENERAL

4. SCOPE. This chapter contains information for the guidance of the personnel responsible for the operation of the Standard Motor-Driven, Horizontal, Model HCC, Cassette Changer. It also contains information on the operation of the equipment, with description and location of the controls.

Section II. SERVICE UPON RECEIPT OF EQUIPMENT

5. UNPACKING AND ASSEMBLING. a. General. This equipment is shipped in three cases. The first contains the entire frame; the second, the mechanism; and the third, the "feet". Unpack the crates. Mount the columns on the "feet". Tighten them firmly and adjust the leveling screws in the "feet" until the columns are perfectly vertical. Set the mechanism on a box between the two legs and attach the mechanism to the four roller brackets. The top roller brackets are each attached by means of two cap screws. The bottom roller brackets are each attached by means of two cap screws and one machine screw. You will have to open the door of the case to see the hole through which the machine screw passes, in order to attach the case to the front side of the bottom brackets. Lift the mechanism to the top of its travel. Remove the two nuts from the studs on the ends of the counterweight chains, being careful that the chains do not get away and fall back into the tube columns. Thread these chains through the top bar of the mechanism, then replace one nut on each stud. Adjust these nuts until the mechanism frame is perfectly horizontal when checked with a spirit level. Replace the other nuts on the studs and tighten them firmly against the first nuts without changing the above adjustment. Insert the long locking rod and handle from the right-hand end; it passes through one guide hole and two clamp castings, one on each leg. If either of these castings does not hold firmly when the locking handle is tightened, tension against the locking

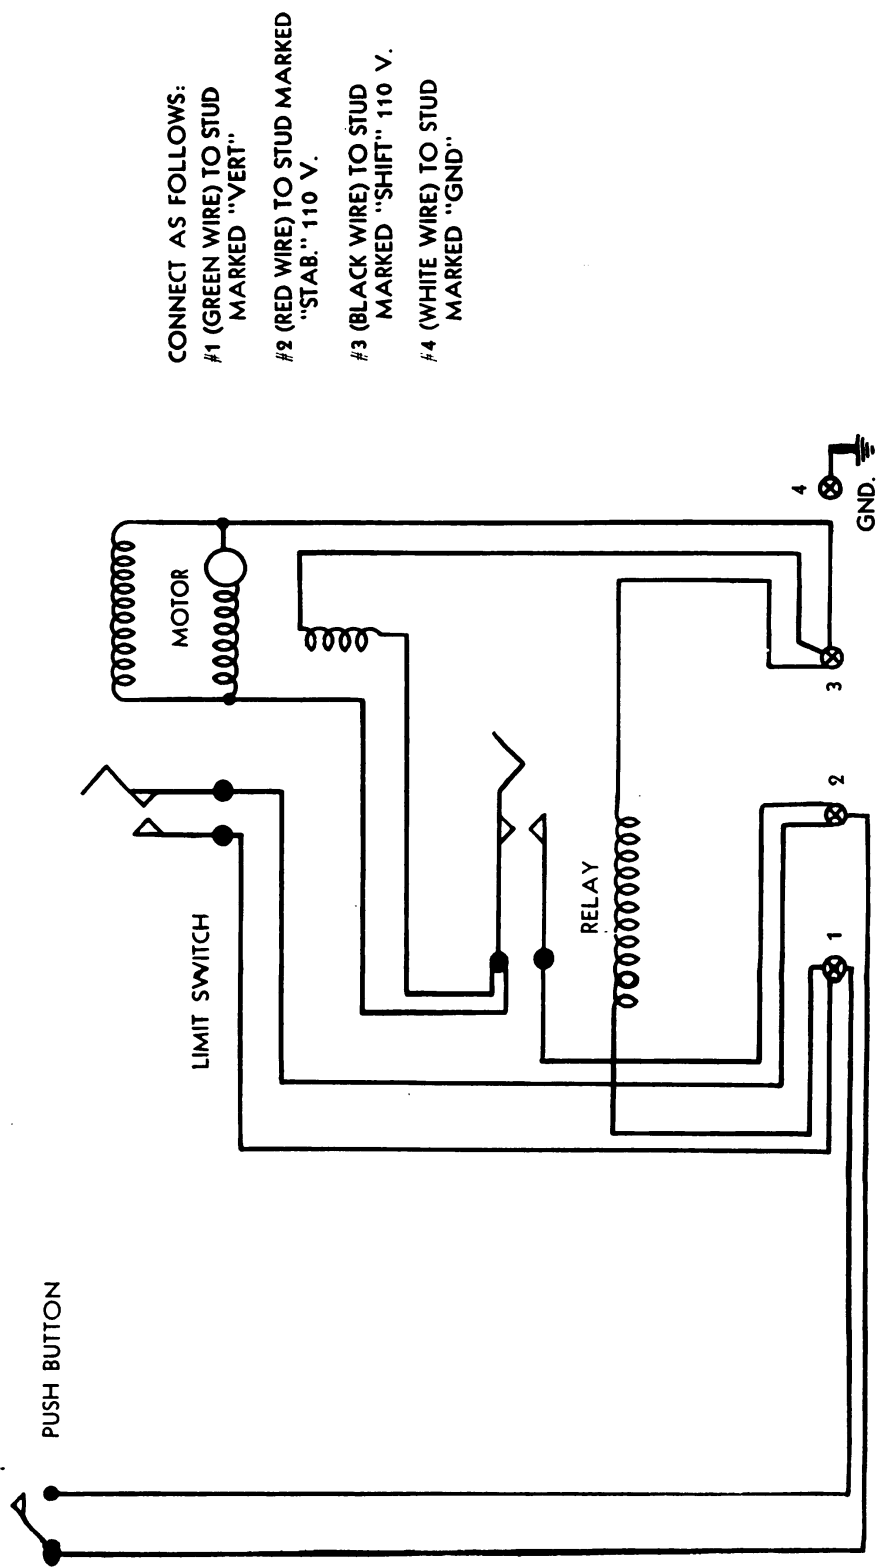

Figure 4. Wiring diagram for connecting Standard Cassette Changer to Standard X-Ray Machines.

Figure 5. Wiring diagram for connecting Standard Cassette Changer to any machine.

handle must be increased. To accomplish this, first locate the two studs which pass through the slots in the ends of clamp castings. Each stud is provided with two lock nuts which, when tightened, will increase the tension. The counterweights are held in place in the columns by means of screws which will be found near the bottom of each column. Do not remove these screws until after the counterweights have been attached.

b. Wiring. Wiring diagrams are shown on pages 6 and 7, which supply required data for electrical connections.

6. DISASSEMBLING AND PACKING. For disassembling, reverse the procedure described in paragraph 5. It is recommended that the equipment be packed in three cases as originally received. Make certain that all parts are effectively braced to prevent movement within the case. Packing materials, such as paper or excelsior, should be employed. Cast parts should be especially well braced to prevent breakage. Chrome-plated or exposed parts should be coated with a light film of oil before packing.

Section III. CONTROLS AND OPERATION

7. CONTROLS. a. Push button. The push button is a hand-operated device located at the end of the rubber-covered cable. Pressing the push button causes the relay coil to be energized. When pressure on the push button is released, the relay coil operates a set of controls which starts the motor, releases the electric brake in the cassette changer, and energizes the stereo-shift.

b. Limit switch. The limit switch is operated by the motor and causes the relay to operate, shutting off the current from the motor and the electric brake.

c. Motor. The motor is attached through reducing gears and a pair of arms to the cassette changer. The cassette carriage moves slowly at first. Its speed increases steadily until it has reached the middle of its travel. From that point onward, its speed decreases. The speed of travel is not adjustable. It has been set at the factory to make the shift in 2 seconds.

CHAPTER 3

OPERATING INSTRUCTIONS

GENERAL ELECTRIC X-RAY CORPORATION MODEL

Section I. GENERAL.

8. SCOPE. This chapter contains information for the guidance of the personnel responsible for the operation of the General Electric Motor-Driven Cassette Changer. It includes information on the operation of the equipment, with description and location of the controls.

Section II. SERVICE UPON RECEIPT OF EQUIPMENT

9. UNPACKING. This equipment is shipped from the factory dismantled into the following major assemblies:

- a. The base casting.
- b. The upright structure.
- c. The housing for the changing and raising mechanism.

Unpack the base casting, 6R05252 (fig. 6). Next unpack the housing, 6R05262-64-66-68 (fig. 6), which contains the changing and raising mechanism. The large box containing the vertical or upright structure should be placed on the floor so that the vertical structure will rest on its back. The top, sides, and ends of the shipping box shall then be knocked out. The bottom of the box is so constructed that the vertical structure is blocked up, making it possible to fasten the base casting, 6R05252 (fig. 6), and to install the housing.

10. ASSEMBLY. a. General. Fasten the base to the vertical structure, using the four bolts furnished, SR00568 (fig. 6). The zinc-plated holes are placed at the rear. Remove the two screws, SR00044 (fig. 6), at the top rear of the vertical structure and take out the two threaded studs, 6R05336 (fig. 6), from the front side. Remove the four screws, SR00562 (fig. 6), on each side at the top and lift off the top casting, 6R05260 (fig. 6). Place the casting aside temporarily. Remove the height-adjustment stop, 6R05338 (fig. 6). The housing for the motor and raising

- | | |
|---------------------|---|
| 1. 6R05290 | Housing, motor and brake |
| 2. 6R05340 | Ears, for wall mounting |
| 3. 6R05336 | Stud, threaded |
| 4. 6R05338 | Stop, height adjustment |
| 5. 6R05280 | Screw, brake |
| 6. SR00568 | Bolt, $\frac{3}{8}$ -16 x $1\frac{1}{4}$ inch, Hex H.M. |
| 7. 6R05278 | Pad, base leveling |
| 8. 6R05262-64-66-68 | Housing, cast iron, left and right side, top and bottom |
| 9. 6R05312 | Channel, cassette |
| 10. 6R05286 | Dispenser, paper, complete: Assembly |
| 11. 6R05260 | Top, cast iron |
| 12. SR00562 | Screw, $\frac{3}{8}$ -16 x $\frac{5}{8}$ inch, R.H.M. |
| 13. SR00044 | Screw, 10-32 x $\frac{7}{16}$ inch, R.H.M. |
| 14. 6R05276 | Plate, indicating |
| 15. 6R05282 | Immobilizer, patient, complete: with roller and crank |

| 17. 6R05270 | Crank, height adjusting |
| 18. 6R05274 | Scale, height indicator |
| 19. 6R05278 | Pad, base-leveling |

Figure 6. External parts of General Electric Cassette Changer.

mechanism can now be installed. To avoid any possibility of marring the surfaces of the upright structure when installing the housing, it is recommended that a cloth be placed over each column from the top to a point about midway down. This will prevent the housing from coming in contact with the front side of the columns when positioning the housing. As soon as the rollers and gears are engaged, these cloths can be removed. Using two men, one at each side, place the housing into the upright structure by inserting it from the top end. Carefully guide it into place so that the rollers engage their respective tracks properly. Turn the crank, 6R05270 (fig. 6), so that the teeth on the pinion gears will mesh with the teeth on the gear racks. Run the housing into the structure far enough to permit reinstallation of the height-adjustment stop, 6R05338 (fig. 6). Place the top casting in position, then fasten it securely to the uprights by means of the screws, SR00562 (fig. 6), on each side. Insert the two threaded studs, 6R05336 (fig. 6), in the ears of the top casting, and insert the screws, SR00044 (fig. 6), through the rear panel, tightening them down firmly. The entire assembly can now be stood upright and moved into the position in which it is to be used.

b. Wall mounting. The base casting for wall mounted installation is fastened to the vertical structure in exactly the same manner as described for floor type installations. Provision is made for anchoring the unit to the wall by means of the ears, 6R05340 (fig. 6), on the top casting. First, remove the two screws, SR00044 (fig. 6), and the two studs, 6R05336 (fig. 6). Bolts or screws can be used for anchoring to the wall, depending upon the wall construction.

c. Converting to left-hand operation. The cassette changer is supplied arranged for right-hand operation of the raising and lowering mechanism. The cassettes can be inserted from either side. If it is desirable to have the raising mechanism arranged for left-hand operation, proceed as follows: remove the bottom cover, 6R05290 (fig. 6), by taking out the eight binding head screws and washers which fasten it in place. This permits access to the raising mechanism. Referring to figure 7, loosen the setscrew and drive out the pin, 6R05292, in the gear, 6R05324, on the end of the crankshaft, 6R05300. Pull out the shaft and crank. Loosen the two setscrews, 6R05296, in the sleeve, 6R05294. Drive out the pin, 6R05342, in the gear, 6R05326, and remove the shaft, 6R05344. Duplicate holes for the assembly just removed are provided on the left side of the housing. Pry off the cap, 6R05346, on the left of the housing and reinstall on the right. Reassemble the mechanism on the left side in exactly the same manner as it was found in the right. Be sure all pins have been installed and all setscrews firmly tightened. Remove the scale, 6R05274 (fig. 6), and the indicator, 6R05276 (fig. 6), from the right-hand column and install them in the same manner on the left column in the holes provided.

- | | |
|-------------|---------------------------------|
| 1. 6R05346 | Cap: For left side installation |
| 2. 6R05288 | Bearing, motor |
| 3. 6R05292 | Pin, locking, 1 inch |
| 4. 6R05294 | Sleeve, crankshaft |
| 5. 6R05324 | Sprocket, crank |
| 6. 6R05270 | Crank, height adjusting |
| 7. 6R05342 | Pin: For holding gear in place |
| 8. 6R05326 | Sprocket, drive shaft |
| 9. 6R05344 | Driveshaft |
| 10. 6R05296 | Setscrew, sleeve |

Figure 7. Internal parts of General Electric Cassette Changer.

d. Leveling. The cassette changer can be leveled by means of the floor pads, 6R05278 (fig. 6), at the front and rear of the base casting. Check with a spirit level. Make certain that the cassette changer is exactly in line with the center of the X-ray table.

e. Cassette channels. The cassette changer is shipped from the factory arranged for use with Rayspeed Universal cassettes. However, provision is made whereby it can be adapted to different types of cassettes as follows: remove the frame on the front of the housing by taking out the eight fillister head machine screws which fasten it in place. The bottom cassette channels are held in place by means of four machine screws. Three sets of holes are provided in the housing for fastening the channels. Referring to the table below, fasten the proper channel in the correct set of holes for the type of cassette to be used.

<i>Cassette type</i>	<i>Holes</i>	<i>Channels</i>
(1) Stele-Weld or Univ-Rayspeed	Top (as shipped from factory)	As shipped from factory
(2) Competitive make	Top (as shipped from factory)	As shipped from factory
(3) Rayspeed (bakelite)	Middle	Use the extra set furnished
(4) G.E. A1	Bottom	Special channels must be ordered from the factory

When the channels have been correctly installed, replace the front frame of the housing and fasten in place.

f. Height indicator scale. The height scale, 6R05274 (fig. 6), on the cassette changer shall be set up to correspond with the height scale on the tube stand. With the X-ray tube stand carriage turned to face the cassette changer, and with the arrow marked "Table Top" of its index scale opposite "25" on the tube column scale, measure the distance from the floor to the focal spot of the X-ray tube. Then raise or lower the cassette changer so that the distance from the center of the cassette changer panel to the floor will be the same as the distance just measured at the tube stand. Keep the cassette changer in this position and move the height scale so that "25" will be directly opposite the indicator. The height scale on the cassette changer is mounted in a small channel. To raise or lower the scale, simply force it up or down by pushing the scale from the top or bottom. If the scale binds, it can be pried off by inserting a screw driver beneath the bottom edge and working upward.

g. Brake adjustment. If the cassette is not parallel with the front panel of the changer, adjustment should be made on the brake screw, 6R05280 (fig. 6). If the brake is too tight, the brake screw should be turned to the left slightly. If the brake is too free, the screw should be turned to the right. The brake will have to be adjusted slightly when the size and type of cassettes are changed.

h. Immobilization device. If the immobilization device, 6R05282 (fig. 6), is a part of the installation, it shall be fastened in place, as shown in figure 6, using the four machine screws furnished. Mounting holes are provided in the housing. Since the cassette changer leaves the factory arranged for right-hand operation, these holes will remain open on the

right side of the housing. An ornamental casting will be found mounted in place on the left side of the housing, which can be removed and installed on the right, thereby affording the necessary mounting holes for the immobilization device on the left side, if desired.

i. **Paper dispenser.** If the paper dispenser, 6R05286 (fig. 6), is a part of the installation, it should be fastened at the top of the housing, as shown in figure 6. The necessary mounting holes are provided in the housing and the mounting screws are furnished with the dispenser.

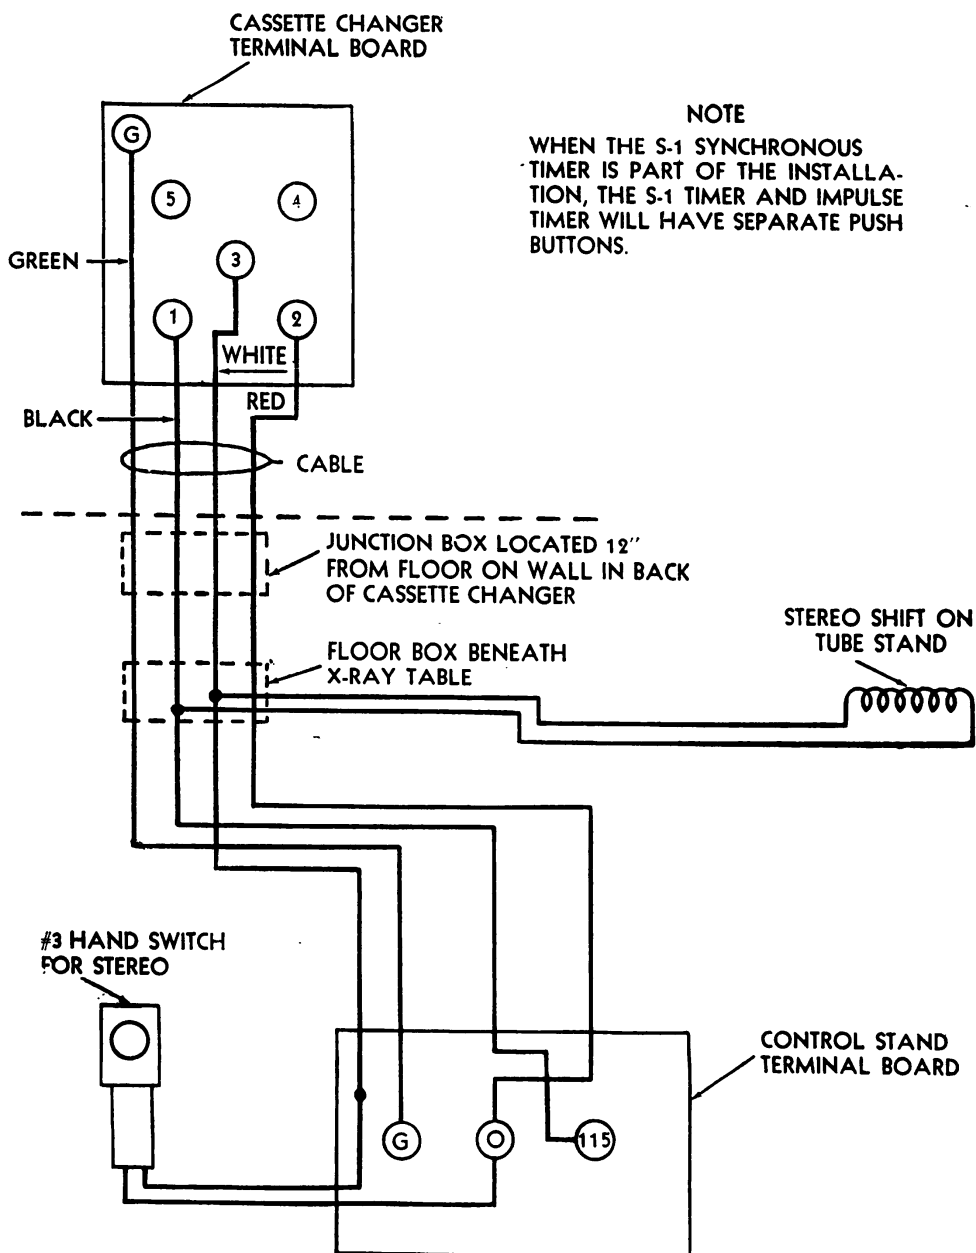

j. **Wiring.** Because the cassette changer is usually installed at the foot or head end of the X-ray table and at a considerable distance from the control stand, it is recommended that the wiring between the control stand and the cassette changer be installed in conduit. If it is desired to install the unit without using conduit, it may be connected to the control stand by means of 4-conductor, rubber-covered cable.

11. DISASSEMBLING AND PACKING. For disassembling, reverse the procedure outlined in paragraphs 9 and 10a. It is recommended that the equipment be packed in the same manner as received originally. Make certain that all parts are effectively braced to prevent movement within the case. Packing materials, such as paper or excelsior, should be employed. Cast parts should be especially well braced to prevent breakage. Chrome-plated or exposed metal parts should be coated with a light film of oil before packing.

Section III. CONTROLS

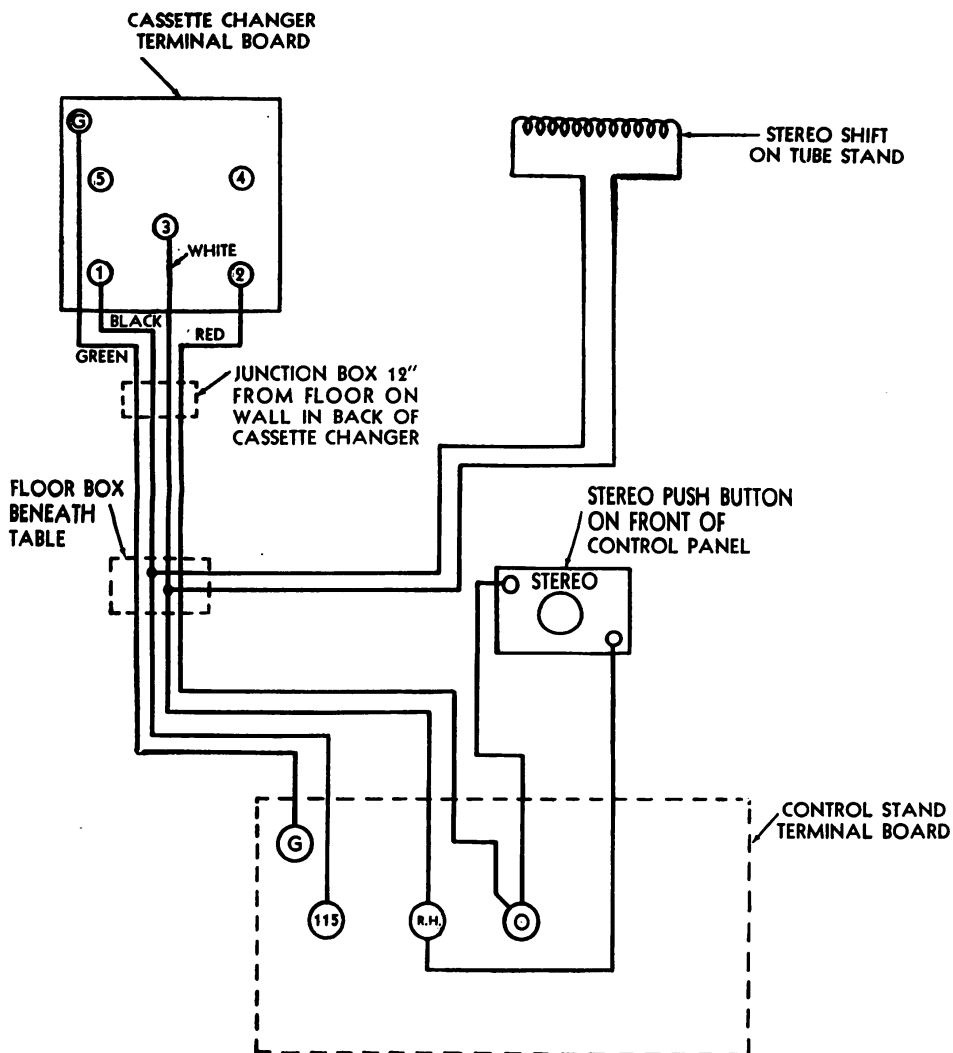

12. CONTROLS. a. Hand switch. The hand switch controls operation of the shifting mechanism. Although the motor must run the entire shifting cycle, the function of the hand switch is only to start the cycle. Once started, the mechanism will continue through the entire shifting cycle. If the tube stand is equipped with a spring-operated tube stereo-shifter, the hand switch should be pressed only momentarily. If the electric motor-operated tube stereo-shift is used, it is necessary to keep the hand switch depressed until the X-ray tube shift is completed. One of two hand switches is issued. One is a single-button hand switch and the other is a two-button hand switch, with one button marked "timer" and another "stereo". The hand switch is provided with a cord which can be attached at the control stand of the X-ray unit, or at the cassette changer.

b. Safety switch. The safety switch is located on the under side of the cassette carriage and serves as a further measure of protection, permitting the power to be disconnected when necessary or desired. This switch is in the OFF position when snapped to the right.

STEREO SHIFT AND A TWO BUTTON HAND SWITCH

Figure 11. Wiring diagram.

c. **Brake-adjustment screw.** The brake-adjustment screw is located at the right on the lower side of the cassette carriage. Its function is to control the brake so that, on shifting, the cassettes may stop in central position, that is, parallel to the front panel of the cassette carriage.

13. OPERATION. a. Electrical connections. After completing assembly of the unit, check figures 8 to 11 and choose the proper diagram for connecting to the control stand on the installation. Make all connections as shown on the wiring diagram. Note that when installing this cassette changer in conjunction with a motor-driven vertical stereo-shifter (fig. 11), it will not be necessary to use the relay in the control stand that was with the balanced cassette changer.

b. Testing the unit. Place two 14- by 17-inch cassettes in the cassette changer channels, 6R05312 (fig. 6), with the front of the cassettes out-

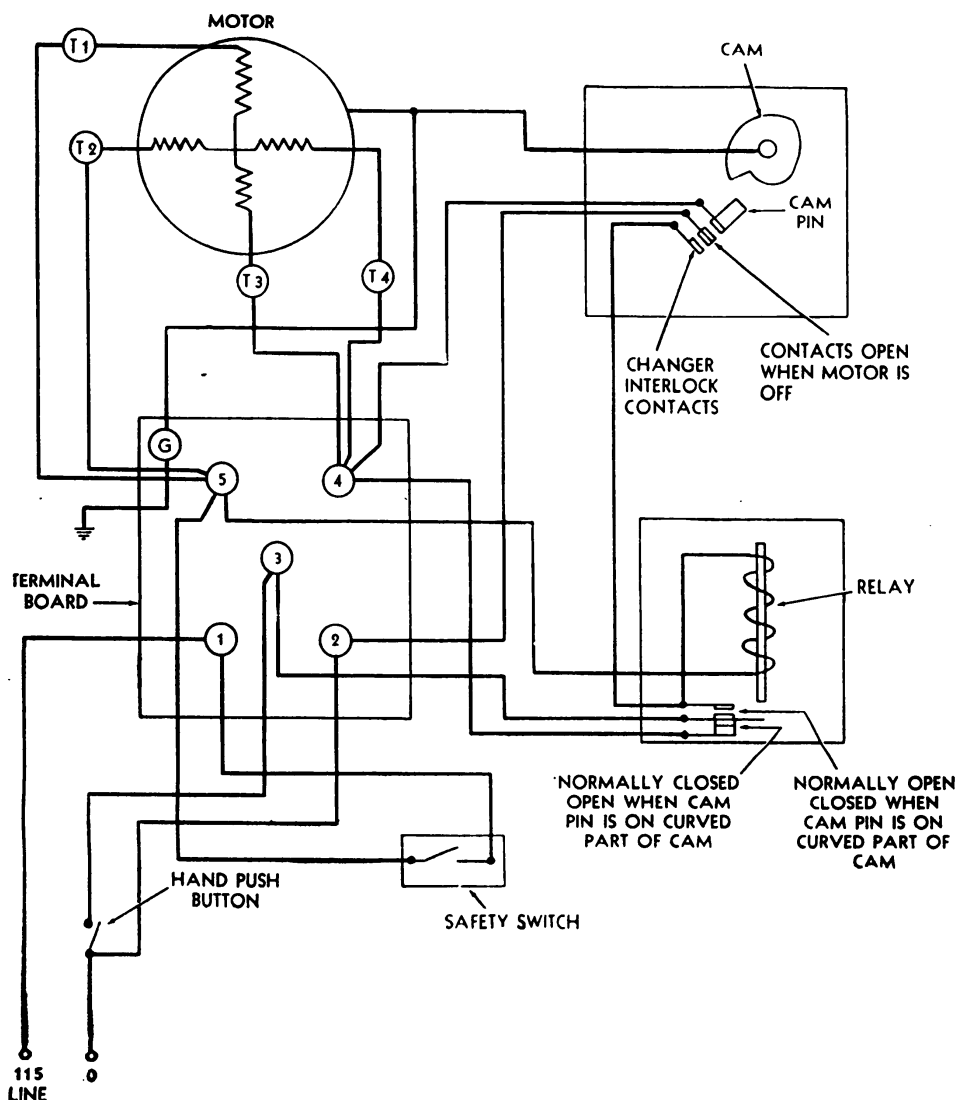

Figure 12. Wiring Diagram of the General Electric Cassette Changer.

ward. Set the tube stand stereo-shifter as indicated in its directions for operation. Place the control stand line switch in the ON position. Press the "stereo" hand-switch button; the cassettes should rotate so that the rear cassette moves to the front of the changer and the tube carriage should move the distance for which it was set. Repeat the above test ten times and observe if the cassette always ends its travel so that the front of the cassette is parallel with the front of the changer. If the cassette is not parallel, adjustments should be made on the brake screw, 6R05280 (fig. 6), as indicated in paragraph 10g. When using the magnetic release type of tube stand stereo-shifter, it is not necessary to hold the "stereo" button down during the entire excursion of the cassette mechanism. However, on the motor type stereo-shifter, it is necessary to press the button until the X-ray tube has completed its travel on the tube stand.

CUT (FURNISHED) 4-CONDUCTOR RUBBER COVERED CABLE TO LENGTH AND SPLICE WIRES AS SHOWN ON ATTACHED WIRING DIAGRAM. ALLOW SUFFICIENT SLACK IN CABLE TO TAKE CARE OF UP AND DOWN MOVEMENT OF CHANGER.

4" x 4" SCREW COVER JUNCTION BOX WITH AN A-3 FEDERAL BUSHING IN COVER. BOX MOUNTED 12" FROM FLOOR IN BACK OF CASSETTE CHANGER.

#4 MOTOR DRIVEN CASSETTE CHANGER

NOTE

ALL SOLDERED CONNECTIONS SHALL BE INSULATED WITH RUBBER AND FRICTION TAPE.

CHAPTER 4

OPERATING INSTRUCTIONS WESTINGHOUSE ELECTRIC AND MANUFACTURING COMPANY MODEL

Section I. GENERAL

14. SCOPE. This chapter contains information for the guidance of the personnel responsible for the operation of the Westinghouse Horizontal Cassette Changer. It also contains information on the operation of the equipment with the description and location of the controls.

Section II. SERVICE UPON RECEIPT OF EQUIPMENT

15. UNPACKING AND ASSEMBLING. This equipment may be shipped in two cases.

a. When opening the crate, the horizontal carriage will be found up-ended and placed between the two uprights. The horizontal carriage should be removed from the crate, leaving the wrapping paper on, and laid aside until the uprights have been placed in position. The upright assembly is shipped completely assembled and it is necessary only to move it into place. On the four corners of the large U-shaped base casting will be found screws whereby leveling may be accomplished. On the rear member of the casting is found a 90° water-level glass. This is for the purpose of obtaining proper leveling, regardless of floor contours. Do not attempt to move the leveling screws with the weight of the uprights upon them. If, for example, it becomes necessary to make any adjustment of the four corners, jam a heavy screw driver or other wedge-shaped device between the base and the floor to take the weight off the leveling pad, make the adjustment, and remove the wedge. Attempting to move these leveling screws with the full weight of the casting upon them may result in a broken screw driver. Inasmuch as this unit operates on the principle of gravity and has no electrical devices of any type except its trip mechanism, the leveling is of extreme importance. After the uprights have been leveled, install the horizontal carriage. This can be accomplished by means of the eight hexagon machine bolts supplied. Fasten the carriage through the eight holes in the upright assembly. After these have been securely tightened, it will be possible

to remove the two long shipping bolts located approximately 6 inches from the bottom of the large chrome-plated columns of the upright. These bolts are intended solely for the purpose of securing the counterweights during shipment of the device. It is suggested that these bolts be kept handy for possible reshipment of the unit.

b. When the unit is packed in two cases, one case contains the mounting base, two upright columns, and the tie rod for joining the two upright columns. The other case contains the horizontal cassette shifting mechanism, compression device, push button, and cable. Uncrate the unit, being careful not to drop or scratch the components in each case. Remove the mounting base and then insert in it the two vertical columns. Tighten the vertical columns in the base by means of four setscrews, using for this operation the small setscrew wrench found in the CAUTION envelope fastened to the column. Remove the tie rod from the case and fasten in place in top of the two support columns, fastening securely to the column by means of the four setscrews identical to those used in the base. Lift the horizontal cassette shifting mechanism to proper level and insert the eight bolts supplied through the back of the cassette changer upright support brackets and into the holes drilled in the back of the horizontal cassette shifting mechanism. Slide the lock washers over these bolts and screw the nuts on tight. Remove nuts from bolts inserted through upright chromium columns, which will be found 1 inch above the base. Withdraw bolts. This will loosen counterweight, and the complete cassette shift mechanism should now be allowed to move freely up and down the column. Level cassette changer base by screwing in or out the leveling screws mounted in the front and rear of each base foot. Adjust by centering bubble in both spirit levels mounted on the top left corner of cassette shifting mechanism housing. An additional "V" bracket is supplied and will be found in case No. 1, which can be used for additional bracing of the cassette changer by fastening the V-bracket to the wall; bolt open ends of the bracket to the upper tie rod by means of the two bolts and nuts which were used at the base column for fastening the counterweights. Attach closed end of the bracket to the wall with lag screws or bolts; insert female 110-volt fitting to proper receptacle in lower right corner of the cassette shifting mechanism, from the rear. This is the magnetic release push button and cable. Insert the male 110-volt fitting into available source of supply and depress attached push button to check operation. The amount of cushioning (vibration control) can be adjusted by movement in or out of the bracket-supporting plunger, found to be mounted at the top right side of the left upright column, viewing cassette changer from the rear. When the cassette shifting mechanism moves smoothly yet quickly, without vibration and jar, the adjustment is correct. The cassette changer is now ready for operation. Remove

wax paper from face of plexiglass panel. The black crinkled paint may be cleaned with a cloth saturated with any thin oil.

16. DISASSEMBLING AND PACKING. Reverse the procedure, as outlined in paragraph 15, packing the unit as originally received. Make certain that all parts are effectively braced to prevent movement within the case. Packing materials such as paper or excelsior should be employed. Cast parts should be especially well braced to prevent breakage. Chrome-plated or exposed metal parts should be coated with a light film of oil before packing.

Section III. CONTROLS AND OPERATION

17. CONTROLS AND OPERATION. a. Magnetic trip mechanism. The magnetic trip mechanism is the means whereby the solenoid coil may be connected in parallel with the trip mechanism of the stereoscopic shift on the tube stand. This will eliminate the need of a separate push-button control for either device. By making a parallel connection between the cassette changer and the tube stand coils, one push button can operate both devices. The cassette changer trip mechanism has a small mercury switch inserted in one side of the coil. This unit will complete the solenoid circuit only when the mechanism is in the No. 1 position. It is purely a safety device to prevent the voltage from being on the trip coil for an excessive length of time. The trip mechanism can be operated either mechanically or electrically. Inasmuch as the unit will operate in one direction, only an indicator located in the upper right-hand side of the horizontal carriage is utilized to indicate the No. 1 and No. 2 positions of the moving frame which holds the cassettes. Make certain that before a stereoscopic exposure is attempted No. 1 shows in the small indicator block. To set the mechanism from the No. 2 to the No. 1 position (preparatory to taking a second radiograph), it is necessary to move down the handle on the right-hand edge of the horizontal carriage. The device cannot be cocked electrically.

b. Plungerlike assembly. In the back of the cassette changer will be found a plungerlike assembly, which is the means of cushioning the shock of the moving parts when changing from No. 1 to No. 2 position. This assembly utilizes a spring and air chamber for softening the shock of the moving carriage. In the event of excessive vibration when the change is made, loosen one of the two screws that hold this assembly and move this assembly in or out as required. In the event the cassette device is tripped and it does not catch hold satisfactorily, it will probably mean that the plunger assembly is advanced too far.

c. Vertical scale. On the right-hand column, facing the cassette

changer, will be found a long vertical scale. This scale can be adjusted by means of the holes that are drilled in it, made to line up with the scale on the vertical column of the tube stand. This scale is properly adjusted at the point where the scale-reading indicated on the cassette changer is the same as that on the stereo-shift when the tube is directed at the exact center of the cassette.

CHAPTER 5

MAINTENANCE INSTRUCTIONS STANDARD X-RAY COMPANY MODEL

Section I. GENERAL

18. SCOPE. This chapter contains information for first and second echelon maintenance of the Standard Motor Driven Horizontal Model HCC Cassette Changer.

Section II. PREVENTIVE MAINTENANCE SERVICES

19. BEARINGS The bearings of the motor-reducing gears should be oiled at least once every 6 months with a good medium grade of machine oil.

20. OPERATING LEVER. Lubricate as indicated in paragraph 19.

21. RATCHET WHEEL SHAFT OF THE RELAY. Lubricate as indicated in paragraph 19. If the apparatus should fail to operate satisfactorily, the trouble will probably be caused by lack of lubrication of the moving parts. Care should be taken not to allow oil to run down onto the small bakelite shoe which is just below the motor and which serves to prevent excessive coasting of the motor after the current has been turned off.

22. MISCELLANEOUS. a. If the motor-drive equipment should become inoperative, it can be disconnected from the cassette carriage by removing the screw from the center of the bearing on the arm which attaches the motor mechanism to the cassette carriage. The cassette carriage can then be shifted manually.

b. If the carriage bumps at either end of its travel, loosen the long post to which the lever is attached on the cassette carriage frame and turn it about $\frac{1}{8}$ of a turn. This will either correct the bumping or it will cause the mechanism to bump harder. If the mechanism bumps harder, loosen this post and turn it about $\frac{1}{8}$ to $\frac{1}{4}$ turn in the opposite direction.

CHAPTER 6

MAINTENANCE INSTRUCTIONS GENERAL ELECTRIC X-RAY CORPORATION MODEL

Section I. GENERAL

23. SCOPE. This chapter contains information for first and second echelon maintenance of the General Electric Motor-Driven Cassette Changer.

Section II. PREVENTIVE MAINTENANCE SERVICES

24. MOTOR BEARINGS. Oil the two motor bearings, 6R05288 (fig. 7), with a good grade medium oil once every 6 months.

25. BRAKE ADJUSTMENT. It may be necessary to adjust the brake, 6R05310 (fig. 6), in winter and summer. When the operating temperature is high the gear grease may become less viscous. In this case, the mechanism may become too free and the unit may recycle until the control line switch is turned off. (See par. 10g.)

CHAPTER 7

MAINTENANCE INSTRUCTIONS WESTINGHOUSE ELECTRIC AND MANUFACTURING COMPANY MODEL

Section I. GENERAL

26. SCOPE. This chapter contains information for first and second echelon maintenance of the Westinghouse Horizontal Cassette Changer.

Section II. PREVENTIVE MAINTENANCE SERVICES

27. VERTICAL CARRIAGE ASSEMBLIES. These assemblies, operating over the chrome-plated columns, are properly adjusted. If the rollers are found to be too tight or too loose, it will be necessary to move one roller. In each set of roller-bearing assemblies, there will be found one on an eccentric stud which permits the bearing to be moved closer to, or farther away from, the vertical column. This is accomplished by tightening or loosening the stud as required.

28. DUST. Keep track and bearings clean and free of dust. Wipe tracks frequently with a damp cloth. Bearings should be removed and washed thoroughly in kerosene or gasoline and repacked with a good grade of light lubricating grease or vaseline.

29. CHANGE OR REPLACEMENT OF COMPRESSION BAND. To replace winding attachment assembly, slide assembly upward until free from winding attachment sliding support. Replace new assembly. To replace band, press ratchet pawl counterclockwise and hold depressed with finger of right hand. At the same time grasp compression band with left hand and pull until completely unwound. Remove belt holder and slip band from it. Insert the belt holder into the new band, replace the belt holder in the roller, and wind the belt onto the roller by turning the handle clockwise. To replace roller, remove the two screws from each end; roller can then be lifted out and replaced. Replace the two screws.

APPENDIX

STANDARD NOMENCLATURE LIST OF PARTS

1. ITEM NO. 60117, CASSETTE CHANGER, STEREOSCOPIC, UPRIGHT, MAGNETICALLY CONTROLLED, STANDARD X-RAY COMPANY.

6R04776	AXLE, PULLEY, COUNTERWEIGHT CABLE
6R04778	WASHER, THIN, COUNTERWEIGHT CABLE PULLEY AXLE
6R04780	WASHER, THICK, COUNTERWEIGHT CABLE PULLEY AXLE
6R04782	BUMPER, RUBBER, VERTICAL TRAVEL STOP
6R04784	BUSHING, BUMPER, VERTICAL TRAVEL STOP
6R04786	CABLE, STEEL, COUNTERWEIGHT...
6R04788	COUNTERWEIGHT, MAIN
6R04790	COLUMN, MAIN, LEFT
6R04792	HOOD, LEFT COUNTERWEIGHT PULLEY
6R04794	CROSS-STRIP, PULLEY HOOD.....
6R04796	NAMEPLATE, "WESTINGHOUSE".....
6R04798	PIN, DOWEL, for attaching counter- weight cable to upper bearing carriage.....
6R04800	WINDOW, VERTICAL TRAVEL INDICATOR SCALE
6R04802	BEARING, BALL, VERTICAL CARRIAGE
6R04804	SCREW, ECCENTRIC, for vertical car- riage bearing and roller.....
6R04806	BUSHING, PIVOT, RELEASE HANDLE
6R04808	ROLLER, MICARTA, VERTICAL CARRIAGE
6R04810	BUSHING, MICARTA ROLLER
6R04812	SLEEVE, VERTICAL CARRIAGE: Casting
6R04814	HANDLE, LOCKING, VERTICAL TRAVEL
6R04816	SHOE, LOCKING, VERTICAL TRAVEL
6R04818	CHASSIS, COMPLETE: Assembly.....
6R04820	NAMEPLATE, WESTINGHOUSE NUMBER AND STYLE IDENTIFI- CATION
6R04822	HINGE, HALF, STATIONARY: For door.....
6R04824	SHIM, HINGE, STATIONARY: For door.....
6R04826	GUARD, LEAD, HINGES, DOOR.....
6R04828	HINGE, HALF, MOVING: For door.....
6R04830	FRAME, DOOR LOCK
6R04832	CATCH, DOOR LOCK
6R04834	SHAFT, DOOR LOCK
6R04836	SPRING, DOOR LOCK
6R04838	BUTTON, DOOR LOCK RELEASE LEVER.....

Medical Dept. No.	Nomenclature	Figure No.
6R04840	COVER, DOOR LOCK	
6R04842	HOOK, LATCH, CASSETTE SHIFT.....	
6R04844	BUSHING, PIVOT, LATCH HOOK.....	
6R04846	SPRING, LATCH HOOK	
6R04848	SPRING, BUMPER, COMPLETE: Assembly.	
6R04850	HOUSING, PLUNGER, SPRING BUMPER	
6R04852	GUIDE, END, SPRING BUMPER.....	
6R04854	SPRING, COMPRESSION, SPRING BUMPER	
6R04856	PLUNGER, SPRING, BUMPER.....	
6R04858	BUMPER, RUBBER, SPRING BUMPER.....	
6R04860	STRAP, MOUNTING, SPRING BUMPER	
6R04862	COLLAR, FELT: For spring bumper mount- ing strap.	
6R04864	BUMPER, RUBBER: For cassette carriage stop.	
6R04866	BUSHING, BUMPER: For cassette carriage stop.	
6R04868	BRACKET, RUBBER BUMPER.....	
6R04870	HOOK: For cassette shift release lever.....	
6R04872	BUSHING, PIVOT: For release lever hook.....	
6R04874	BUMPER, RELEASE LEVER HOOK.....	
6R04876	SPRING RETURN: For release lever hook.....	
6R04878	ROD, CONNECTING, CASSETTE SHIFT RELEASE	
6R04880	PIN, CONNECTING ROD: For release lever and cassette shift.....	
6R04882	GUIDE, SUPPORT, CONNECTING ROD	
6R04884	HANDLE, RELEASE, CASSETTE SHIFT	
6R04886	PIN, RELEASE HANDLE: For connecting rod and cassette shift.....	
6R04888	BRACKET, SUPPORT, RELEASE HANDLE	
6R04890	PLATE, INDICATOR, SLIDING: For cassette shift.	
6R04892	GUIDE: For sliding indicator plate.....	
6R04894	BUSHING, SLIDING INDICATOR.....	
6R04896	BUMPER, SLIDING INDICATOR.....	
6R04898	BUSHING: For sliding indicator bumper..	
6R04900	SPRING, RETURN SLIDING INDI- CATOR	
6R04902	HOUSING: For sliding indicator plate....	
6R04904	EYELET: For sliding indicator window....	

Medical Dept. No.	Nomenclature	Figure No.
6R04906	CARRIAGE, CASSETTE, SHEET METAL
6R04908	ARM, CATCH, LATCH HOOK.....
6R04910	ARM, CATCH, RELEASE LEVER HOOK
6R04912	PIN, GUIDE, PLUNGER CATCH.....
6R04914	SPRING, PLUNGER CATCH, CASSETTE
6R04916	ROLLER, END, CASSETTE CARRIAGE
6R04918	BUSHING: For cassette carriage end roller.
6R04920	SPACER, CASSETTE CARRIAGE END ROLLER
6R04922	ROLLER, CENTER, CASSETTE CARRIAGE
6R04924	BUSHING, CENTER ROLLER.....
6R04926	CHANNEL, SUPPORT, CASSETTE.....
6R04928	GUIDE, CHANNEL
6R04930	SCREW, THUMB, CHANNEL SUPPORT
6R04932	BRACKET, CASSETTE, ADJUSTABLE.
6R04934	NUT, THUMB, CASSETTE BRACKET..
6R04936	SPRING, PRESSURE, CASSETTE CHANNEL
6R04938	SPRING, PRESSURE, CASSETTE BACK
6R04940	SEGMENT, ROCKING, CASSETTE SHIFT
6R04942	BUSHING, PIVOT, SEGMENT.....
6R04944	STRIP, BRASS, LEFT SEGMENT.....
6R04946	STRIP, BRASS, RIGHT SEGMENT.....
6R04948	WEIGHT, ROUND, SEGMENT.....
6R04950	BAR, TIE, SLOTTED: Attaches rocking segments together.
6R04952	BUSHING, PIVOT: For tie bar.....
6R04954	LEVER, COCKING, CASSETTE SHIFT.
6R04956	BUSHING, COCKING LEVER AND TIE BAR
6R04958	SCREW, SHOULDER, COCKING LEVER AND TIE BAR.....
6R04960	GUIDE, CABLE, STEEL
6R04962	BUSHING, STEEL CABLE GUIDE.....
6R04964	SCREW, SHOULDER, STEEL CABLE GUIDE
6R04966	HANDLE, COCKING, CASSETTE SHIFT
6R04968	BUSHING, PIVOT, COCKING HANDLE
6R04970	CABLE, STEEL, FLEXIBLE, 1/16-INCH DIA., 25 1/2-INCH LENGTH.....

Medical Dept. No.	Nomenclature	Figure No.
6R04972	LUG, CABLE, STEEL
6R04974	SOLENOID, MAGNETIC TRIP, COM- PLETE: Assembly.
6R04976	COIL, SOLENOID
6R04978	SPRING, PLUNGER, MAGNETIC TRIP, SOLENOID
6R04980	PLUNGER, SOLENOID, MAGNETIC TRIP
6R04982	PIN, MAGNETIC TRIP, SOLENOID PLUNGER
6R04984	HOUSING, MAGNETIC TRIP, SOLENOID
6R04986	PLATE, INSULATOR: At bottom of solenoid.
6R04988	BUSHING, INSULATING, SOLENOID TERMINAL
6R04990	STRIP, INSULATING, SOLENOID TERMINAL
6R04992	CAP, TERMINAL, SOLENOID.....
6R04994	CLAMP, CABLE, MAGNETIC TRIP, SOLENOID
6R04996	LEVER, CONNECTING, MAGNETIC TRIP
6R04998	WASHER, RUBBER, SOLENOID PLUNGER
6R05000	PLATE, MOUNTING, RECEPTACLE...
6R05002	RECEPTACLE, MALE, RECESSED, TWO-PRONG, MAGNETIC TRIP....
6R05004	CATCH, CASSETTE PLUNGER.....
6R05006	PLUG, MAGNETIC CABLE FEMALE CONNECTOR
6R05008	PLATE, MOUNTING, MERCURY SWITCH
6R05010	PIN, STOP, MERCURY SWITCH BRACKET
6R05012	SPACER, MERCURY SWITCH MOUNTING PLATE
6R05014	COVER, MERCURY SWITCH
6R05016	BRACKET, MOUNTING, MERCURY SWITCH
6R05018	BUSHING, PIVOT, MERCURY SWITCH BRACKET
6R05020	CLIP, MOUNTING, MERCURY SWITCH
6R05022	BUMPER, RUBBER, MERCURY SWITCH BRACKET
6R05024	SPRING, RETURN, MERCURY SWITCH BRACKET
6R05026	COMPRESSION DEVICE, COMPLETE: Assembly.

Medical Dept. No.	Nomenclature	Figure No.
6R05028	RAIL, OUTER, COMPRESSION DEVICE	
6R05030	BUSHING, SPACER, COMPRESSION DEVICE, RAIL	
6R05032	SUPPORT, COMPLETE SLIDING BELT	
6R05034	SLIDE, COMPRESSION DEVICE BELT SUPPORT	
6R05036	FASTENER, BELT, SLIDE, COMPRES- SION DEVICE	
6R05038	BUSHING, PIVOT, SLIDE, BELT FASTENER	
6R05040	SCREW, THUMB, BELT SUPPORT SLIDE	
6R05042	BAND, COMPRESSION DEVICE.....	
6R05044	ATTACHMENT, WINDING, COMP- LETE: Assembly, for compression device.	
6R05046	SUPPORT, SLIDING, WINDING ATTACHMENT	
6R05048	ROLLER, BELT, COMPRESSION DEVICE	
6R05050	HOLDER, BELT, WINDING ATTACH- MENT	
6R05052	BUSHING, COMPRESSION DEVICE BELT ROLLER	
6R05054	RATCHET, COMPRESSION DEVICE WINDING ATTACHMENT	
6R05056	SPACER, ARM, HANDLE, COMPRES- SION DEVICE	
6R05058	ARM, HANDLE, COMPRESSION DEVICE	
6R05060	HANDLE, COMPRESSION DEVICE WINDING ATTACHMENT	
6R05062	BUSHING, HANDLE, WINDING ATTACHMENT	
6R05064	PAWL, RATCHET, WINDING ATTACH- MENT	
6R05066	SPRING, RATCHET	
6R05068	BUSHING, SPRING, RATCHET PAWL	
6R05070	SCREW, RATCHET PAWL SPRING...
